

INTIVO — Decision Intelligence System Hierarchy

Core Idea

Intivo is a **layered Decision Intelligence system** that transforms enterprise revenue execution into a structured, real-time decision process.

It starts with **Sales as the entry wedge**, then expands into a unified **Revenue Decision Layer (Sales + Marketing + Customer Success)**, followed by financial, operational, and risk intelligence layers.

Each layer operates independently but contributes to a unified decision system.

LAYER 1 — SALES DECISION LAYER (ENTRY WEDGE)

Purpose

Optimize sales execution decisions to maximize deal conversion and pipeline efficiency.

Core Decisions

- Which deals should be prioritized today?
 - What is the probability of closing each deal?
 - Which opportunities are at risk?
 - What is the next best action to close a deal?
-

Key Capabilities

- Deal prioritization engine
 - Win probability prediction
 - Pipeline risk detection
 - Next-best-action recommendations
-

Data Inputs

- CRM systems (HubSpot, Salesforce)
 - Deal stage history
 - Sales activity (emails, calls, meetings)
 - Engagement signals
-

Output

“What should sales teams focus on right now to maximize deal conversion?”

LAYER 2 — REVENUE DECISION LAYER (EXPANSION LAYER)

Purpose

Unify all revenue-generating functions into a single decision system.

This layer expands Sales into a full Revenue Intelligence system.

Includes

2.1 SALES (Core — already established in Layer 1)

- deal prioritization
- win probability
- pipeline forecasting

2.2 MARKETING

- lead quality scoring
- channel performance optimization
- CAC efficiency analysis
- attribution intelligence

2.3 CUSTOMER SUCCESS

- churn prediction
- retention risk detection
- customer health scoring
- expansion opportunity identification

Unified Output

“What actions across Sales, Marketing, and Customer Success maximize revenue outcomes?”

LAYER 3 — FINANCIAL DECISION LAYER

Purpose

Translate revenue decisions into financial forecasting and planning.

Core Decisions

- What is expected revenue over time?
- How should budgets be allocated?
- What scenarios impact profitability?
- Where are financial inefficiencies occurring?

Key Capabilities

- revenue forecasting engine
 - scenario simulation system
 - budget optimization model
 - variance detection (forecast vs actual)
-

Data Inputs

- revenue data
 - financial statements
 - revenue layer outputs
 - cost structures
-

Output

“What financial outcomes will result from current business decisions?”

LAYER 4 — OPERATIONAL DECISION LAYER (SUPPLY CHAIN/LOGISTICS)

Purpose

Optimize execution efficiency across business operations.

Core Decisions

- How should resources be allocated?
- Where are operational bottlenecks?

- How can workflows be optimized?
 - How can delivery efficiency be improved?
-

Key Capabilities

- resource optimization engine
 - workflow decision engine
 - process efficiency modeling
 - execution planning system
-

Data Inputs

- internal workflows
 - system logs
 - operational metrics
 - resource availability
-

Output

“How do we execute business decisions faster and more efficiently?”

LAYER 5 — RISK & TRUST DECISION LAYER

Purpose

Prevent financial loss, fraud, and operational risk.

Core Decisions

- Is this activity fraudulent or abnormal?
 - What transactions should be blocked or flagged?
 - What compliance risks exist?
 - What anomalies indicate system risk?
-

Key Capabilities

- fraud detection engine
 - anomaly detection system
 - risk scoring models
 - compliance monitoring layer
-

Data Inputs

- transactional data
 - behavioral signals
 - historical fraud patterns
 - system logs
-

Output

“What risks exist in the system, and how should they be mitigated in real time?”
